

Provenly

On-chain provenance and royalty tracking for physical goods via NFT tags

The Problem & Our Solution

Physical goods lack verifiable provenance, making counterfeiting easy and resale royalties nearly impossible to enforce.

- Counterfeiting is easy without a verifiable link between a physical item and proof of origin
- Creators lose resale royalties once goods leave the primary sale
- Provenly mints an NFT twin for each physical item, tagged with QR or NFC
- Every resale is recorded on-chain, enforcing royalty splits automatically
- Buyers can scan the tag to verify authenticity instantly

How It Works

From minting to resale, every step ties a physical item to its on-chain twin, verified with a simple scan.

- Brand mints an NFT twin and attaches a QR/NFC tag to the physical item
- Buyer scans the tag to verify authenticity and view ownership history
- Resale marketplace enforces royalty splits on every verified transaction
- All mints, transfers, and resales are recorded on Solana
- Built with Anchor, Metaplex, and Solana Pay for fast, low-cost transactions

Built with

Solana, Anchor, Metaplex, React,
NFC/QR SDK, Node.js, Solana Pay

Why Now & What's Next

Compressed NFTs on Solana make tagging mass-market goods economically viable, unlike costly Ethereum minting.

- Cheap, compressed minting on Solana enables tagging thousands of items affordably
- Next: partner with a small fashion or art brand for a pilot batch
- Add compressed NFTs to scale to thousands of items cheaply
- Build a resale marketplace plugin for Shopify stores
